ACKNOWLEDGEMENTS

CHASA would like to acknowledge and thank the following persons and their effort:

1. The CHASA Sub-Committee for developing the SA Measuring Method:
 - Piet Smit
 - Nico van Rooyen
 - Chappie Sparks
 - Carel Höllfor their time, effort and energy spend on formulating and setting up the SA Measuring Method which is still used by all CHASA affiliated member organisations;
2. The Trophy Committee of Bosveld Jagters en Wildbewaringsvereniging:
 - Freek Nel
 - Louis Botha
 - Hannes Davel
 - Gert Rall
 - Hannetjie Botes (Secretary)who facilitated the making of the video used in the training course of CHASA Official Measurers;
3. Rory o'Moore and Desiré Thyse from the CHASA Head Office for maintaining and compiling the records;
4. Joki le Roux for drafting the introduction and feedback on the records;
5. The SA Recordbook Sub-Committee for their effort and energy in compiling the first SA Record book:
 - Riaan Meintjes – Vrystaat Jagters en Wildbewaringsvereniging
 - Nico Wepener – Bosveld Jagters en Wildbewaringsvereniging
 - Johan Kapp – Bosveld Jagters en Wildbewaringsvereniging
6. CHASA Member Associations who hold trophy competitions;
7. The official measurers who spend countless hours measuring trophies for that rare occasion when the “large one” appears;
8. To Johannes Richter and William Smale for assistance with the final stages of preparing the document for publishing;
9. Those trophy hunters, who through sustainable hunting practices give us the opportunity to record their trophy measurements for future reference.

INTRODUCTION

The soul of the hunter

In order to survive, our primeval ancestors had to hunt. Even after they switched to primitive agriculture, they still had to hunt animals threatening their crops. The men were exclusively responsible for providing meat to their families/tribes and the individual who regularly returned to the shelter with the most meat, received the most adoration from their family or tribe.

It was important that the best hunting genes were passed on from generation to generation. The San, Eskimo or Pygmy hunter who regularly killed the largest animal was probably regarded as a hero by his tribe. After the meat had been eaten, the only evidence of their consistent hunting skill was probably the record-sized pair of springbuck or eland horns in the *niche* in their cave, the giant tusk of the walrus outside the igloo's entrance, or the massive bongo horns perched against a tree.

"Modern" humans are still driven by primitive genes and instincts. The urge to survive and procreate ensures the survival of the human species, even if we think that we are no longer directly dependant on nature. The trophy hunter's urge to display evidence of the largest of a species in their modern "shelter" is well established!

Trophy hunting, and all elements pertaining to it, require great commitment. This does not refer to professional hunters (who are obliged to provide the best possible trophies to their clients), but specifically to the local trophy hunter who mostly hunts on his own or at most makes use of a tracker or guide. Trophy hunters in South Africa who have mostly relied on their own skill to obtain their trophies, are in general better hunters than the foreign hunter, who has collected impressive trophies with the aid of a professional hunter. In the latter case the hunt is mostly executed by the tracker and professional hunter, while the client only walks along and pulls the trigger when advised to do so by the professional hunter.

Apart from the **hunting** of a trophy animal and all that it encompasses, the trophy hunter must be knowledgeable about a variety of other aspects of trophy hunting, such as: the **distinction between male and female animals** of particularly those species that both have horns; guidelines regarding **trophy estimation** in the veld; the proper way of **managing trophies** (skinning, treatment, etc.); **taking pictures** (a photo is also a trophy!); the **measurement of trophies** according to the prescriptions of CHASA (even though it will also be helpful to be knowledgeable about guidelines of other institutions such as Rowland Ward and SCI (Safari Club International); the **care of mounted trophies**, etc.

Serious trophy hunters normally spend much more time in the hunting field than the “biltong” hunter (who is usually satisfied with the first good opportunity). The reason for this is that trophy hunters often do not use an opportunity to shoot an animal if the animal does not meet their self-determined requirements or if they are looking for a record trophy. Consequently, trophy hunters generally develop great hunting skills, since they can mostly only rely on themselves, learn to be very patient (a great life skill) and get to know the veld and wildlife intimately. Furthermore, they spend much more money on hunting while killing fewer animals, which is beneficial to the hunting industry in general. Although it is estimated that non-trophy hunters annually contribute three times more to the hunting industry than trophy hunters do, it is foreign trophy hunters in particular (rather than non-trophy hunters) who play a big role in the ongoing success of game populations. In addition, the great majority of foreign hunters who visit South Africa are serious trophy hunters, and the foreign currency they spend here is vital to our hunting industry.

It is very unusual for a hunter to start his or her hunting career by specifically hunting trophies. Hunters usually move through a number of stages as they become more mature in the activity:

- During the first stage, when people start to hunt (whether as a child or an adult), they usually measure their success according to the **number of animals they shot**.
- In the second stage, it is the **quality of the prey**, usually determined by the length of the horns or tusks, which becomes important. A kudu with fifty inch horns is more important to this hunter than one whose horns are thirty inches long, even though the first mentioned kudu’s meat tastes better than that of the latter. This selectivity develops as hunters become more experienced and their status as **hunter** becomes more important than the amount of meat they bring home. In many instances these hunters try to demonstrate their success and skill to other hunters by displaying their trophies on their walls or by participating in trophy competitions.
- The next stage is **specialising** (a different form of selectivity) where hunters may for example decide to only hunt species with spiral horns (bushbuck, kudu, eland and nyala), and later – should they be able to afford it – sitatunga, bongo or the mountain nyala, or the Big or Small Five.
- Lastly, hunters begin to **increase the hunt’s level of difficulty** by for example placing limits on their weapons (e.g. only using black gunpowder weapons, hand weapons or a bow and arrow) as they become more experienced and skilled. Being successful at using these weapons enhances the hunters’ satisfaction. Few sport participants choose to limit themselves in this way, but in doing so hunters intensify the challenge and pleasure as they level the playing field. As long as this is done in a responsible way, a hunter’s skill is improved.

- A very last stage is one in which hunters are keen to hunt, **but think of several reasons rather not to kill the animal (even though the opportunity to take a shot presents itself)!**

Not all hunters move through said stages, but most reach the quality or trophy hunting stage. In this stage some hunters are content with mounting a few skulls on their barbecue wall, while others are only happy with complete mountings of every species they hunted.

What exactly is a trophy?

Suitable definitions of a trophy are:

- Anything taken during war, hunting, competition, etc. especially when preserved as a memento, spoil, prize or award.
- Anything serving as a token or evidence of victory, valour, skill, etc.
- Trophies (such as an animal's head mounted on a wall) are reminders of successful hunts.

Why trophy hunting?

To fully experience a hunt, an element of exclusivity should be present and it should be a challenge to outsmart a scarce prey. If one shoots a few sheep kept in a kraal, then one is not hunting, but shooting. To hunt means that one is searching for a scarce and elusive prey. The playing field is levelled during a true hunt, since the prey combines its survival instinct, exquisite senses and acquired knowledge of previous hunts to elude the hunter. The prey also relies on its natural camouflage to remain hidden from the hunter (e.g. a kudu), or uses its agility to evade the hunter (e.g. a springbuck). It uses its sharp senses (sight, hearing and smell) and that undefined (but very real) sixth sense, and is familiar with its environment in the same way as we know our backyard. The fact that trophy hunters come from concrete jungles with polluted air, high noise levels and fast changing light intensities and are often over-worked, stressed and jaded, furthermore favours the prey.

Trophy hunting can also be seen as a way of boosting one's ego. When a San, Pygmy or Eskimo returns with his springbuck, geelrug, duiker or seal respectively, he is highly regarded for demonstrating his skill as hunter and provider. The success of the modern hunter is also often measured by the quality of the trophy. The larger the horns, tusks or skull, the older, more cunning and elusive the prey usually was. The quality of the trophy therefore reflects the skill and experience of the hunter. Modern hunters also demonstrate their skill in other "hunting activities", e.g. in a business where the client is the "prey". With their trophy collection, hunters prove that they are successful business people who can afford to hunt scarce and expensive trophies. Even if we don't show our trophies to anyone,

the extent of our satisfaction is dependant on our self-determined standards, and we generally live by the motto that “Bigger is better”. It’s true to our nature as humans. We feel good when we can add a trophy to our collection, because it is tangible proof that we have succeeded once more.

Another reason why we hunt trophies is because we respect the prey, even though this may sound contradictory. Who would want to hunt sheep or cattle? No one respects sheep or cattle’s survival instinct or ability to be elusive or sly. Who would shoot a chicken with a shotgun when the pheasant, yellow-billed duck or quail offers a much greater challenge? The more contact the hunter has with the prey (or **less** contact because the animals are being sly), the more respect the true trophy hunter develops for it. Just think of the so called “grey ghost”, the bountiful, common kudu. Only hunters who have often returned home empty-handed have that special admiration and respect for a kudu. Since hunters also study the habits of their prey, they get to know the species well. The more they try to decrease the gap between their own skill and that of prey, the greater their respect for the prey.

Many of us hunt trophies because we are collectors. As children we collect signatures, marbles, stamps, eggs, etc. As adult hunters some of us collect samples of the species we hunt. Since the goals of all hunters differ to a lesser or greater extent, some prefer, for example, to collect all types of spiral horned buck or hartebees, or maybe the Big or Small Five. Our collections are only limited by our physical abilities, imagination, time and of course financial resources. We may strive to collect trophies that could qualify for the Top 10 Rowland Ward, SCI or CHASA, but we may never achieve this goal. The pleasure lies in the effort, whether successful or not.

The majority of hunters set and monitor their own ethical standards. Since hunting is not a spectator sport, your own moral values will determine whether you would insist that the guinea fowl you shot while it was on the ground was actually shot in mid air, or whether the trophy kudu you shot while taking aim from the truck’s mirror was indeed a trophy hunt. We are only bluffing ourselves if we pretend that the large mane lion in our trophy collection was shot in Dark Africa, while we know that it was raised on donkey meat, is familiar with people and could not flee from the 50 ha camp. Everyone must live with their own conscience.

The possibility of danger adds excitement and challenge to a hunt. A buffalo or bushbuck ram can attack, one can fall from a tree or cliff, sprain an ankle, be bitten by a snake, stung by bees, or contract life-threatening diseases like malaria or Bilharzia. Hunters who regularly hunt dangerous game often tell themselves after a hunt that they would never hunt again, only to start planning the next hunt a few months later! The fight-or-flight syndrome, caused by the release of adrenaline in the hunter’s blood, can serve as an addictive drug. It is not, however, only while hunting a dangerous animal that one can experience the effect of adrenaline. Hunting a steenbuck trophy ram with a bow or a hand weapon can have the same effect on you, albeit to a lesser extent.

The famous author, Robert Ruark, in his classic book ***Use enough gun*** wrote the following about hunting trophies, as explained to him by the well-known professional hunter, Harry Selby:

You are not shooting an elephant. [...] You are shooting the symbol of his tusks. You are not shooting to kill. You are shooting to make immortal the thing you shoot. To kill just anything is a sin. To kill something that will be dead soon, but is so fine as to give you pleasure for years, is wonderful. Everything dies. You only hasten the process. When you shoot a lion you are actually shooting its mane, something that will make you proud. You are shooting for yourself, not shooting just to kill.

While on another occasion, after Selby and he shot an exquisite lion, Ruark writes:

Already I was beginning to fall into the African way of thinking: that if you properly respect what you are after, and shoot it cleanly and on the animal's terrain, if you imprison in your mind all the wonder of the day from sky to smell to breeze to flowers – then you have not merely killed an animal. You have lent immortality to a beast you have killed because you loved him and wanted him forever so that you could always recapture the day. [...] This is better than letting him grow a few years older or crippled by a son and eaten, still alive, by hyenas. Death is not a dreadful thing in Africa – not if you respect the thing you kill, not if you kill to feed your people or your memory.

HISTORY OF THE SOUTH AFRICAN MEASURING SYSTEM

After long and thorough deliberations, the Confederation of Hunting Associations of South Africa (CHASA) decided to recommend the creation of a true South African measuring system to all affiliated societies.

This recommendation was wholeheartedly accepted by all affiliated societies, and on the 7th of November 1986 a subcommittee was appointed by CHASA. Its goal was to prepare a draft measuring method that could be used by affiliated societies.

Attention was given to all aspects involved in such a system, with the following guidelines serving as foundation:

- It must have a true South African character and fully address all our needs;
- It must be simple and easy to understand, thereby eliminating the possibility of subjective interpretations and ensuring the highest level of accuracy; and
- To ensure continuity in the system, the established form thereof must be preserved and not changed continuously.

With this system we acknowledge the species, subspecies and distribution areas (with the exception of a few) as used in issues 1-19 of Rowland Ward's *Records of Big Game*.

Exceptions are:

Springbuck (Normal and Western)

For the purpose of this system, no distinction is made. All springbuck are thus grouped together and the distribution area will therefore comprise the total area of both subspecies.

Impala (Southern and Black-faced)

The distinction between these two species will remain, subject to the following conditions with regards to the black-faced impala:

- a. Final confirmation of inclusion in the national list will rest with the subcommittee of CHASA.
- b. The following must be handed in with the entry:
 - ▷ Clear colour photos of the front (frontal) and side (profile) of the face of the animal.

- ▷ The complete details of the date of the hunt, exact place (name of farm, district and country), as well as the name and address of the owner of the farm on which the trophy was hunted.

Lechwe (Red and Kafue)

A third subspecies is added, namely the exotic red lechwe, with current distribution area comprising the RSA and Namibia.

Defasse Waterbuck (Rhodesian and Angolan)

Only one subspecies is acknowledged, namely the Rhodesian Defasse waterbuck, whose distribution area includes the total distribution area of the two separate subspecies.

Roan Antelope (Southern and Angolan)

Only one subspecies is acknowledged, namely the southern roan antelope, whose distribution area includes the total distribution area of the two separate subspecies.

HOW TO HAVE YOUR TROPHY ENTERED IN THE SA RECORD BOOK

A member of a CHASA Member Association may have his or her trophy measured in accordance with the SA Measuring Method, either individually by a CHASA Official Measurer or at any official trophy competition of his or her CHASA Affiliated Association, and if the trophy measures the same or longer than the minimum length required for inclusion in the SA Record Book, he or she may have such trophy recorded therein.

For more information, contact the CHASA Head Office at 041-922 5600.

Website: www.chasa.co.za

DEALING WITH TROPHIES

Great trophies are often ruined because of incorrect or inadequate handling during or shortly after the hunt.

Tips for handling a trophy:

- Skin the animal as soon as possible. Decomposition sets in immediately after death, and delaying this process could result in hairslip. Klipspringer, Nyala and bushbuck are particularly at risk.
- Do not drag the carcass over stone or gravel. If it cannot be lifted, roll it onto a heavy tarpaulin and drag the tarp to move it.
- To protect the skin, put something soft in the back of the truck before loading the carcass. Be careful not to damage the skin or horns when loading or unloading it from the recovery vehicle or when transportation it.
- Keep the carcass cool and out of the sun. Heat can cause hairslip.
- Remove all fat and meat from the skin, as it can contribute to putrefaction. Pay particular attention to zebra, but be careful not to cut the mane follicles.
- Wash the skins thoroughly to remove all dirt and blood and soak in a tub of heavily salted water and a couple of caps of Savlon or Dettol for about 5 hours to kill any bacteria.
- Hang the skins for a short while to drain off excess water before salting.
- Always use fresh salt.
- Leave the salt on the skin for 48 hours, then shake to remove excess salt and hang in a cool, shady place to dry (never in the sun).
- Do not drape skins over any metal pipes; rust stains can spoil the skin.
- Do not pack skins in plastic bags; rather use an open bucket.
- Make longitudinal cuts (about 10 cm apart) on skins thicker than 7 mm to enable the salt to penetrate.
- Never use formalin products to preserve skins.
- Karbadust and naphthalene can be used to prevent insects from spoiling trophies.
- Use good, sharp knives, which will minimise accidental cuts.

Salting

- Only use clean, good quality salt; fine grain if possible.
- Put a layer of salt on the floor, then lay the hairy side of the skin onto it.
- Rub salt thoroughly into the wet side of the skin, particularly into all the tears and hollows, and make sure that the skin is covered by a thick layer of salt. Several skins can be stacked if they are adequately salted.
- Store the salted skins in this way for about 24 to 48 hours, then shake them to loosen the salt and hang them in the shade to dry.
- Before it is completely dry, fold the skin (hairy side facing inwards) into the shape in which it will be despatched to avoid cracking.
- Then unfold it to allow further drying.
- Skins must be folded with the hairy side facing upwards. Fold the edges inwards towards the middle so that the hair is protected.
- Never store or transport skins in plastic bags or sealed containers for any length of time as this will ruin them.
- Clearly mark all skins and trophies. Cable ties and plastic tags which can be bought from most taxidermists or are homemade work well. Write all the necessary detail onto the tag with a permanent marker.

Note:

Store skins and trophies out of reach of rodents, dogs, etc.

Cuts for shoulder mount

Cut a v-shape between the horns, and cut along the centre of the back. If the animal has a mane, then cut along one side of it. Keep the desired position of the mounted head in mind before deciding which side of the mane to work on. Make an incision around the trunk approximately one third down the body length, and then around the two front legs at the knees. Then proceed to cape the animal.

There is no special knack or secret to skinning and caping an ordinary game animal. Some (like warthog) are a bit more difficult, and others (like an eland) are pretty large, but all you basically need to cut a good cape is patience, a sharp knife, and attention to detail.

Observe what the skinners do, get tips from them, and practice on a few of your biltong animals. Practice makes perfect.

Skulls

Cut off the entire skull at the neck. Cut away as much meat as you can and remove the lower jaw, since it is generally not needed by the taxidermists.

Remove the brain through the spinal cord opening by thoroughly stirring it with a stick first and then washing it with water. Repeat this as often as necessary to remove all brain matter.

You can also place the skull in boiling water to soften the facial meat which can then be easily removed. Take care not to immerse the horns or the basal pads of reedbuck, since the water could damage it. If using fire to heat the water, make sure the horns are protected. Drain the water from the skull.

Fill the brain cavity and nasal passages with salt, then put aside (out of reach of rodents etc.) until dry. Once dry, you can send it to the taxidermist.

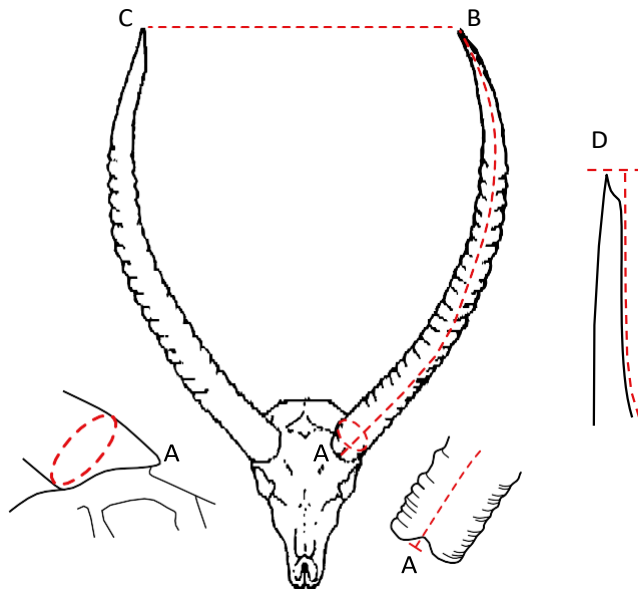

If you want to finish the skull off yourself for a European mount, first ensure that it is dry and clean, then paint the skull with water-based and diluted cold glue and the horns with a formalin and black oxide and wood boring solution, or spray them with Q20.

SA METHODS OF MEASUREMENT

SA MEETMETODES

Method of Measurement a

Meetmetode a

This method is used for most horned African species, except if a particular method measurement already exists.

Hierdie meetmetode word vir meeste Afrika-spesies met horings gebruik, tensy daar reeds 'n spesiale meetmetode bestaan.

Length of the horns

Measurements are taken along the front curve of the longest horn, starting from the lowest point of the base on the forehead to the tip of the horn (A-B), as indicated on the drawing.

Lengte van horing

Afmetings word al langs die voorste kurwe van die langste horing geneem, vanaf die laagste punt van die basis op die voorkop tot by die punt (A-B), soos in die skets aangedui.

NB: Measurements are taken in a straight line across the ridges on horns with uniform ridges (waterbuck, blesbuck, impala, etc.) and the measuring tape is therefore not moulded into crevasses.

LW: Afmetings word in 'n reguit lyn oor die riwwe op horings met eenvormige riwwe (waterbokke, blesbokke, rooibokke, ens.) geneem en maatband word dus nie in die holtes ingedruk nie.

Should the tip of a horn be broken or blunt, the measurement is taken up to a point which is at a right angle to the longest part of such a tip (see D in drawing).

Circumference at base

Measurement is taken at right angles to the axis of the longest horn, as close as possible to the skull (see drawing).

NB: Where the horn protrudes from the skull at a crooked angle, an elliptic measurement is therefore not taken. The curve at the bottom of the horn can thus not be followed.

Point-to-point

Measurement is taken in a straight line from the tip of one horn to that of the other (C-B).

NB: Write a note to indicate if one horn is broken and it is therefore not possible to take these measurements.

Position on list

Is determined solely by the length of the longer horn. In the case of equal measurements, the sequence of the dates on which the hunts took place will be listed, with the oldest measurement listed first.

Indien die punt van 'n horing gebreek of stomp afgewerk is, word afmeting tot by 'n punt reghoekig met die langste deel van so 'n punt geneem (sien D in illustrasie).

Omtrek by basis

Afmeting word reghoekig met die as van langste horing geneem, so na as moontlik aan die skedel (sien illustrasie).

LW: Waar die horing die skedel teen 'n skuinshoek verlaat, word daar dus nie 'n elliptiese afmeting geneem nie. Die kurwe van die onderkant van die horing word dus nie noodwendig gevolg nie.

Punt-tot-punt

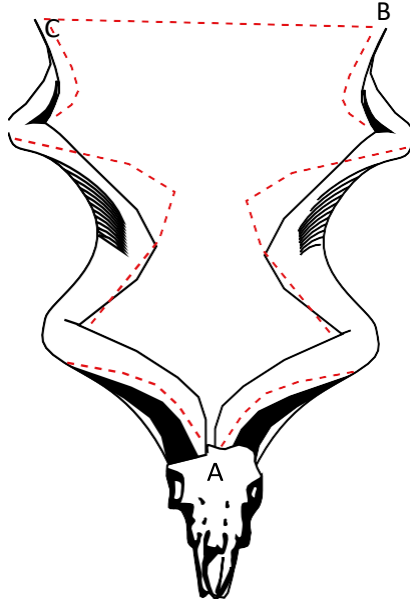

Afmeting word in 'n reguit lyn vanaf die punt van een horing tot punt van ander geneem (C-B).

LW: Dui d.m.v. 'n nota aan indien een horing gebreek is en hierdie afmeting dus nie bepaalbaar is nie.

Posisie op lys

Word uitsluitlik deur die lengte van die langer horing bepaal. In die geval van gelyke afmetings sal dit in die volgorde van die datum waarop dit gejag is gelys word, met die oudste afmeting eerste.

Method of Measurement B MeetMetode B

This method is used for all spiral horns, for example kudu, eland, bushbuck, etc.

Length of horn

The starting point of the measurement is the point at which the horn forms a rift on the forehead. Follow the rift along the highest level to the tip (A-B or A-C).

NB: Measurement is taken around the spiral.

Circumference at the base

Measurement is taken as described in Method A.

Point-to-point

Measurement is taken as described in Method A.

Position on list

As done in Method A.

Hierdie meetmetode word gebruik vir alle spiraalhorings, byvoorbeeld koedoe, eland, bosbok, ens.

Lengte van horing

Afmeting word geneem deur te begin by die punt waar die rif van die horing op voorkop vorm. Volg die rif al langs die hoogste vlak tot by die punt (A-B of A-C).

LW: Afmeting word om die spiraal geneem.

Omtrek by basis

Afmeting word soos vir Metode A geneem.

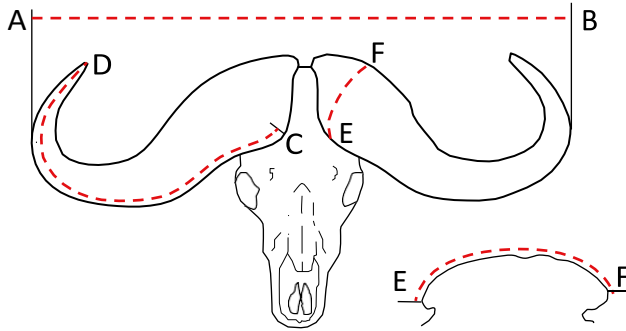

Punt-tot-punt

Afmeting word soos vir Metode A geneem.

Posisie op lys

Soos by Metode A.

Method of Measurement C

This method is used for the southern and northern buffalo, blue wildebees, Nyasaland wildebees and Cookson's wildebees. (The measurement of the dwarf buffalo is done according to Method A.)

Outside width or spread

Measurements are taken between the widest points of the outside curves of the two horns by using two carpenter's squares on a level surface (A-B).

Length of the horn

Measurements are taken from a point obtained by halving the angle the palm forms on the forehead (see drawing) along the front curve of the longest horn up to the tip of the horn (C-D).

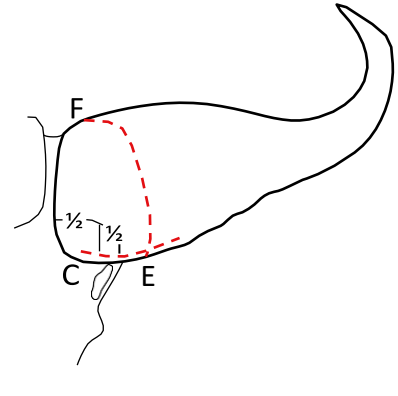

Width of palm

Measurement is made from the widest palm at the broadest place from the back edge, over the curve of the palm up to the front edge (see drawing). Measurement is made at right angles to the axis of the horn at that point (E-F).

Position on list

Determined by the outside width or spread.

Meetmetode C

Hierdie meetmetode word vir die suidelike en noordelike buffel, blouwildebees, Njassaland wildebees en Cooksonse wildebees gebruik. (Die dwergbuffel word volgens metode Agemeet.)

Buitewydte of span

Afmetings word tussen die buitenste wydste punte van die kurwes van die twee horings geneem deur gebruik te maak van twee winkelhake op 'n gelyk oppervlak (A-B).

Lengte van horing

Afmeting word geneem vanaf die punt verkry deur die hoek wat die palm op die voorkop vorm te halveer (sien illustrasie), al langs die voorste kurwe van die langste horing tot by die punt (C-D).

Breedte van palm

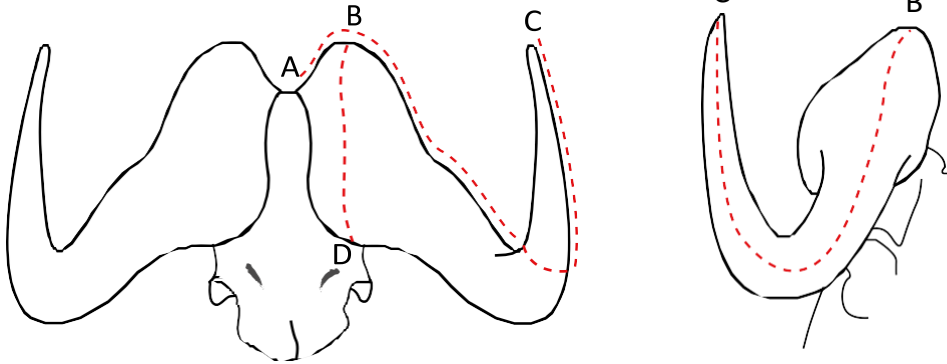

Afmeting word van die breedste palm by die breedste plek vanaf die agterste rand, oor die kurwe van die palm, tot by die voorste rand geneem (sien illustrasie). Afmeting word reghoekig met die as van die horing by daardie punt geneem (E-F).

Posisie op lys

Word deur buitewydte of span bepaal.

Method of Measurement d

Meetmetode d

This method is used for the black wildebeest.

Length of the horn

Measurement is started at a point on the top of the head where the horn and skin meet, along the highest point of the palm, along the outside silhouette of the longest horn, up to the tip of the horn (A-B-C).

Width of palm

Measurement is taken from the lowest point at the bottom of the base, across the palm up to the highest point on the top of the palm (D-B). Measurement is thus not necessarily taken parallel to the axis of the skull or at right angles to the axis of the horn.

Point-to-point

Measurement is taken according to the method described in A.

Position on list

Is determined exclusively by the length of the longest horn.

Hierdie metode word vir die swart-wildebees gebruik.

Lengte van horing

Afmetings word by 'n punt bo-op die kop waar horing by vel aansluit begin, oor die hoogste punt van die palm, al langs die buitenste silhoeët van die langste horing, tot by die punt (A-B-C).

Breedte van palm

Afmeting word vanaf die laagste punt aan die onderkant van die basis, oor die palm, tot op die hoogste punt bo-op die palm geneem (D-B). Afmeting word dus nie noodwendig parallel met die as van die skedel of reghoekig met die as van die horing geneem nie.

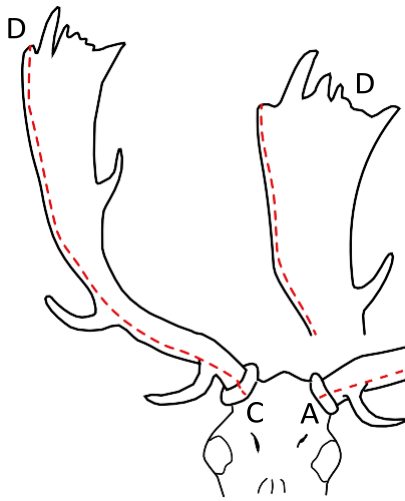

Punt-tot-punt

Afmeting word soos by meetmetode A geneem.

Posisie op lys

Word uitsluitlik deur die lengte van die langste horing bepaal.

Method of Measurement e

This method is used for the fallow.

Length of antlers

Measurements of both antlers are made from the point where the antlers and skull meet on the forehead, across the rosettes at the base, along the front of antlers to their tips (A-B) and (C-D).

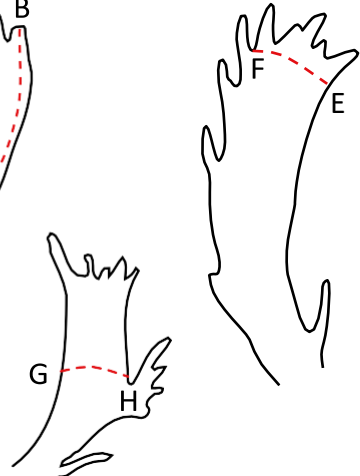

NB: Should the tips be broken, the measurement is taken up the starting point of the break on the front edge (see drawing).

Width of palms

Measurement is taken at the broadest point on both palms, at a right angle to the axis thereof. Start the measurement at the front edge and follow the outer curve of the palm to the back edge of the indentation between two points (E-F and G-H).

NB: The point of the indentation must be at least one inch wide.

Meetmetode e

Hierdie meetmetode word vir die damhart gebruik.

Lengte van geweie

Afmetings van albei geweie word geneem vanaf die punt waar die geweie en skedel op die voorkop bymekaar aansluit, oor die rosette by die basis, al langs die voorkant van die geweie, tot by die punte (A-B) en (C-D).

LW: Indien die punt gebreek is, word afmetings geneem tot waar breek op voorste rand waarlangs gemeet word begin (sien illustrasie).

Breedte van palms

Afmeting word by breedste punt op albei palms, reghoekig met die as daarvan, geneem. Begin die afmeting by die voorste rand en volg die buitenste kurwe van die palm tot by die agterste rand by die inham tussen die twee punte (E-F en G-H).

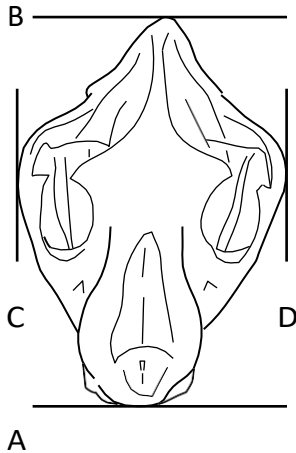

LW: Punt vir inham moet ten minste een duim wees.

Position on list

Is determined by dividing the sum totals of both the antlers and the width of both palms by two.

Posisie op lys

Word bepaal deur die somtotaal van die lengte van albei gewee, sowel as die breedte van albei palms, deur twee te deel.

Method of Measurement f

This method is used for cat skulls.

Length of skull

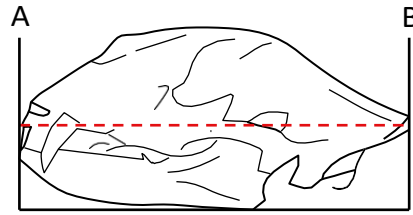

Measurement of the length of the skull is taken by using two carpenter's squares on a level surface (A-B).

Width of skull

Measurement of widest part of the skull is taken in the same way as for the length (C-D).

Position on list

Is determined by die sum total of both measurements.

MeetMetode f

Hierdie meetmetode word gebruik vir katskedels.

Lengte van skedel

Afmetings van die lengte van die skedel word geneem deur twee winkelhake op 'n gelyk oppervlak te gebruik (A-B).

Breedte van skedel

Afmeting van die breedste deel van die skedel word geneem op dieselfde wyse as vir lengte (C-D).

Posisie op lys

Word deur die somtotaal van albei afmetings bepaal.

Method of Measurement G

This method is used for the tusks of elephants.

Weight of the tusks

Weight of each tusk to the nearest $\frac{1}{4}$ pound.

Length of tusk

Length of tusk on the outer curve.

Circumference of tusk

Circumference of each tusk where it protrudes from the gums.

Position on list

Is determined by the weight of the heaviest or only tusk.

Meetmetode G

Hierdie meetmetode word vir olifantande gebruik.

Gewig van tand

Gewig van elke tand tot naaste $\frac{1}{4}$ pond.

Lengte van tand

Lengte van elke tand op buitekurwe.

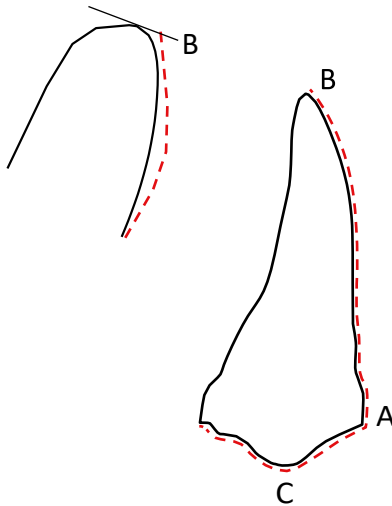

Omtrek van tand

Omtrek van elke tand waar dit by tandvleis uitkom.

Posisie op lys

Word deur die gewig van die swaarste of enigste tand bepaal.

Method of Measurement h

This method is used for rhino horns.

Length of horns

Measurement is taken by starting at the place where the skin connects to the horn at the front, all along the curve of both horns up to the tips (A-B).

NB: Measurement at the tip must be taken at a point level with the point furthest away from it (see drawing).

Circumference of horns

Measurement must be taken at the bases by following the bottom edge where the skin and horns meet (C).

NB: This measurement is thus not the same as the circumference measurement used in method A.

Position on list

Is determined by the length of the front horn.

MeetMetode h

Hierdie meetmetode word vir renosterhorings gebruik.

Lengte van horings

Afmetings word geneem deur te begin waar die vel en horing aan die voorkant bymekaar aansluit, al langs die voorste kurwe van albei horings, tot by die punte (A-B).

LW: Afmeting by die punt moet tot 'n punt gelyk met die verste punt daarvan geneem word (sien illustrasie).

Omtrek van horings

Afmeting word by basisse geneem deur die onderste rand te volg waar die vel by horings aansluit (C).

LW: Hierdie afmeting is dus nie dieselfde as die omtrekafmeting met betrekking tot metode A nie.

Posisie op lys

Word deur lengte van voorste horing bepaal.

Method of Measurement I

This method is used for the crocodile.

Length of skull

Measurement is taken of the total length of the skull (with or without the skin of the nose), with the jaw closed, by using carpenter's squares on a level surface.

Width of skull

Measurements are taken at the widest point on the skull (with or without skin), in the same way as above.

Position on list

Is determined by the sum total of the two measurements.

Meetmetode I

Hierdie meetmetode word vir krokodil gebruik.

Lengte van skedel

Afmetings word geneem van die totale lengte van die skedel (met of sonder neusvel), met bo- en onderkaak opmekaar, deur gebruik te maak van winkelhake op 'n gelyk oppervlak.

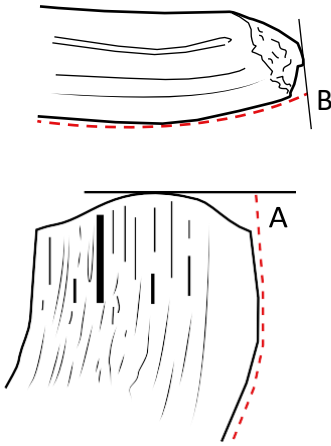

Breedte van skedel

Afmeting word by breedste punt van skedel (met of sonder vel) op dieselfde wyse as hierbo geneem.

Posisie op lys

Word deur die somtotaal van die twee afmetings bepaal.

Method of Measurement J

This method is used for the warthog and giant bush pig.

Length of tusk

Measurements of the entire length of the longest **upper tusk** are taken along the outer curve (A-B). Start the measurement at a point at a right angle to the highest point of the edge at the base of the tusk (see drawing). The same goes for blunt or broken tips.

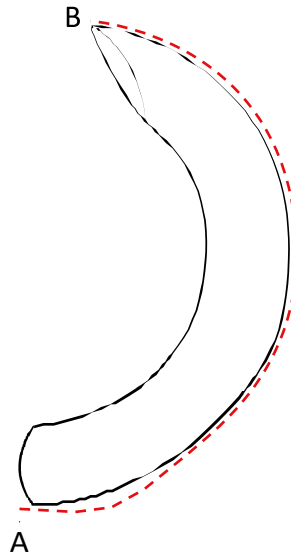

Length of the tusk protruding from the gums

Measurement is taken from the gum along the outer curve of the longest **upper tusk**.

Position on list

Is determined by the length of the longest or only **upper tusk**.

MeetMetode J

Hierdie meetmetode word vir die vlakvark en reuse bosvark gebruik.

Lengte van tand

Afmetings word van hele lengte van die langste **bo-tand** al langs die buitenste kurwe (A-B) geneem. Begin die afmeting by 'n punt reghoekig met die hoogste punt van die rant by die basis van die tand (sien illustrasie). Dieselfde geld vir stomp of gebreekte punte.

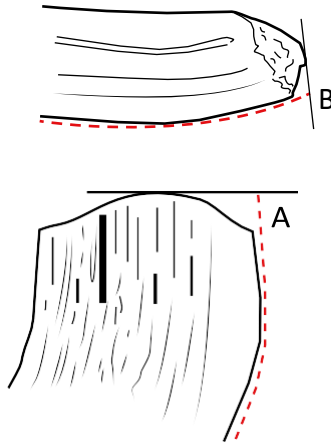

Lengte van tand wat by tandvleis uitsteek

Afmeting word vanaf die tandvleis al langs die buitenste kurwe van die langste **bo-tand** geneem.

Posisie op lys

Word deur lengte van langste of enigste **bo-tand** bepaal.

Method of Measurement K

This method is used for the bush pig and hippopotamus.

Length of tusk

Measurement of the entire length of the longest **lower tusk** is taken along the outside curve (A-B). Start the measurement at a point at a right angle to the highest point of the edge at the base of the tusk (see drawing). The same goes for blunt or broken tips.

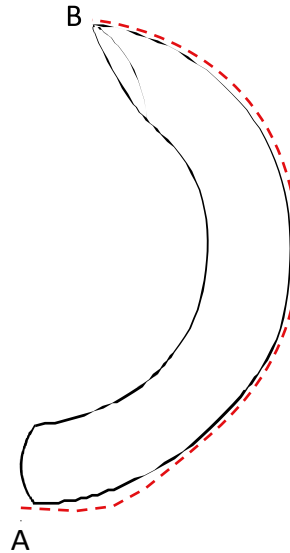

Length of tusk protruding from gums

Measurement is taken from the gum along the outside curve of the longest **bottom tusk** to the tip.

Position on list

Is determined by the length of the longest **bottom tusk**.

Meetmetode K

Hierdie meetmetode word vir die bosvark en seekoei gebruik.

Lengte van tand

Afmeting van hele lengte van die langste **onderste tand** word al langs die buitenste kurwe geneem (A-B). Begin afmeting by 'n punt reghoekig met hoogste punt van rant by die basis van tand (sien illustrasie). Dieselfde geld by stomp of gebroke punte.

Lengte van tand wat by tandvleis uitsteek

Afmeting word vanaf die tandvleis, al langs die buitenste kurwe van die langste **ondertand**, tot by die punt geneem.

Posisie op lys

Word deur lengte van die langste **ondertand** bepaal.

ERKENNINGS

CHASA wil graag die volgende persone bedank en erkenning aan hulle verleen vir hul bydrae tot die SA Rekordboek:

1. CHASA Subkomitee vir die ontwikkeling van die SA Meetmetode:

- Piet Smit
- Nico van Rooyen
- Chappie Sparks
- Carel Höll

vir hulle tyd en energie wat hulle afgestaan het om die SA Meetmetode se standaarde en werkswyses daar te stel en welke nog steeds deur CHASA lidverenigings gebruik word;

2. Trofeekomitee van Bosveld Jagters en Wildbewaringsvereniging:

- Freek Nel
- Louis Botha
- Hannes Davel
- Gert Rall
- Hanneljie Botes (Sekretaresse)

vir die fasilitering van die maak van die SA Meetmetode vir Jagtrofeë, welke video steeds gebruik word as deel van die opleidingsproses van CHASA Amptelike Meters;

3. Rory o'Moore en Desiré Thyse van die CHASA hoofkantoor vir die verwerking en byhou van die rekords;

4. Jokl le Roux vir die skryf van die inleiding en verdere insette rondom die SA Rekords;

5. SA Rekordboek Subkomitee:

- Riaan Meintjes – Vrystaat Jagters en Wildbewaringsvereniging
- Nico Wepener – Bosveld Jagters en Wildbewaringsvereniging
- Johan Kapp – Bosveld Jagters en Wildbewaringsvereniging

vir hul bydrae en werk om die eerste gepubliseerde weergawe van die SA Rekordboek die lig te laatsien;

6. Lidverenigings van CHASA vir die hou van trofeekompetisies;

7. CHASA Amptelike Meters wat ure bestee om trofeë te meet in die hoop dat daardie grootte oor hul pad kom;

8. Johannes Richter and William Smale vir hul ondersteuning in die finale stadiums van die voorbereiding van hierdie dokument vir publikasie;

9. Trofeejagters, wie se jagtogte onderhewig aan die beginsel van volhoubare benutting en die meting van hul trofeë, dit moontlik maak om rekord te hou van mates van trofeediere vir toekomstige verwysing.

INLEIDING

Die siel van die jagter

Ons oer voorouers moes jag om te kon oorleef, en selfs ná daar oorgeskakel is na primitiewe landbou, moes hulle bly jag om hul oeste te beskerm. Dit was die uitsluitlike plig van die manlike geslag om vleis aan hulle gesin/familie/stam te voorsien, en daardie individu wat gereeld die meeste vleis skuing toe gebring het, het gewoonlik ook die meeste voorregte van die vroulike geslag geniet.

Dit was belangrik dat die beste jaggene van generasie tot generasie oorgedra word. Die San-, Eskimo- of Pigmee-jagter wat gereeld die grootste dier platgetrek het, het heel waarskynlik heldestatus onder hul stamgenote verkry. En ná die vleis opgeëet is, was dit waarskynlik slegs die rekordstel springbok- of elandhorings op die nis bokant sy lêplek in die grot, reuse walrus-slagtand buite die iglo se deuropening of massiewe bongohorings teen 'n boomstam wat as bewys van hul jagbekwaamheid gedien het.

Ons “moderne” mense word maar nog steeds deur primitiewe gene en drange beheer. Die oorlewings- en voortplantingsdrange sorg dat die mens as spesie bly voortbestaan, selfs al dink ons dat ons nie meer direk van die natuur afhanklik is nie. Die drang van trofeejagters om bewyse van die grootste van 'n spesie na hul moderne “skuilings” te neem en daar ten toon te stel, het nog heel goed behoue gebly!

Trofeejag, en alles wat daarmee saamgaan, vereis baie toewyding van die trofeejagter. Hier word nie verwys na die professionele jagter (met al die verpligtinge wat hy het om die beste moontlike trofee aan sy kliënte te besorg) nie, maar spesifiek na die plaaslike trofeejagter, wat meestal op sy eie (of hoogstens met behulp van 'n spoorsnyer of gids) jag. Die Suid-Afrikaanse trofeejagter wat grotendeels deur sy eie vernuf 'n goeie versameling trofee opgebou het, is oor die algemeen 'n baie beter jagter as die buitelandse jagter met sy indrukwekkende versameling trofee wat hy met behulp van 'n beroepsjagter geskiet het. In laasgenoemde geval word die jagwerk meestal deur die spoorsnyer en beroepsjagter gedoen, terwyl die kliënt net saamloop en die sneller trek wanneer die beroepsjagter die jagter aansê om dit te doen.

Benewens die jag van die trofee-dier en alles wat daarmee gepaard gaan, moet die trofeejagter ook op hoogte wees van 'n verskeidenheid ander aspekte, wat insluit: die onderskeid tussen manlike en vroulike diere van veral daardie spesies waar beide geslagte horings het; riglyne i.v.m. trofeeskating in die veld; die hantering van trofee (slag, behandeling, ens.); die neem van foto's ('n foto is ook 'n trofee!); die opmeting van trofee volgens die voorskrifte van CHASA (alhoewel dit ook nuttig is om op hoogte te wees

van die riglyne vir opmeting van ander instansies soos Rowland Ward en SCI (Safari Club International)); die versorging van gemonteerde trofeeë; ens.

Ernstige trofeejagters spandeer normaalweg baie meer tyd in die jagveld as die “biltong”-jagter (wat gewoonlik tevrede is met die eerste beste geleentheid), omdat baie geleenthede nie geneem word om ’n dier te skiet as laasgenoemde nie aan jagters se selfopgelegde standaard voldoen nie, of hulle op soek is na ’n rekordboektrofee. As gevolg hiervan ontwikkel trofeejagters wat grotendeels op hulself aangewese is oor die algemeen baie goeie jagvaardighede en leer hulle om geduld te beoefen (’n puik lewensvaardigheid) en die veld en wildlewe intiem te ken. Verder spandeer hulle baie meer geld aan jag terwyl hulle minder diere doodmaak, wat voordelig is vir die jagindustrie oor die algemeen. Alhoewel nie-trofeejagters volgens berekening jaarliks tot drie maal meer geld as die trofeejagters tot die wildindustrie bydra, bevoordeel veral buitelandse trofeejagters waarskynlik dus die volgehoue sukses van wildpopulasies in ’n meerdere mate as wat nie-trofeejagters dit doen. Verder is die oorgrote meerderheid buitelandse jagters wat Suid Afrika besoek ernstige trofeejagters, en die buitelandse valuta wat hulle hier spandeer is essensieel vir ons jagindustrie.

Dis uiters selde dat jagters hulle jagloopbaan begin deur spesifiek vir trofeeë te jag. Jagters vorder gewoonlik deur ’n aantal stadiums namate hulle in hulle sport groei:

- Tydens die eerste stadium, wanneer ’n persoon begin jag (of dit nou in kindertyd of volwasse lewe is), is dit gewoonlik die **hoeveelheid diere wat die jagter skiet** waaraan jagters in daardie stadium hulle sukses meet.
- In die tweede stadium is dit die **kwaliteit van die prooi**, wat gewoonlik aan die lengte van die horings of tande gemeet word, wat op die voorgrond tree. ’n Koedoe met vyftig-duim horings is vir hierdie jagter belangriker as een wie se horings dertig duim lank is, al is eersgenoemde koedoe se vleis smaakliker as laasgenoemde s’n. Dit is ’n tipe selektiwiteit wat ontwikkel namate jagters meer ervare raak, en hulle **status as jagters** belangriker raak as die hoeveelheid vleis wat huis toe geneem word. In baie gevalle probeer hierdie jagters dan ook om hulle vaardighede en sukses aan medejagters te bewys deur die trofee teen die muur ten toon te stel, of aan trofeekompetisies deel te neem.
- Die volgende stadium is **spesialisering** (’n ander vorm van selektiwiteit) waar die jagter bv. slegs die spiraalhoringspesies (bosbok, koedoe, eland, njala) jag, en later – as die jagter dit kan bekostig – sitatunga, bongo en berg njala, of die Klein Vyf of Groot Vyf.
- Laastens begin jagters, namate hulle meer bekwaam en ervare raak, om die **moeilikheidsgraad van die jag te verhoog** deur bv. hulle jaggereedskap te beperk (deur bv. slegs met swartkruit wapens, handwapens of pyl-en-boog te jag). Die sukses hiervan verhoog die jagter se tevredenheid. Daar is min sportdeelnemers

wat hulself vrywilliglik op dié manier beperk, maar as jagters dit doen, verhoog hulle die uitdaging en genot deur op 'n meer gelyke vlak met sy of haar prooi te kompeteer. Solank dit op 'n verantwoordelike manier gedoen word, word die jagter se vernuf verbeter.

- 'n Heel laaste stadium is die een waar die jagter graag gaan jag, maar **allerlei verskonings uitdink om liewer nie die dier (wat wel 'n skoot aanbied) te skiet nie!**

Nie alle jagters vorder deur al die genoemde stadiums nie, maar die meerderheid bereik wel die kwaliteit- of trofeejagstadium waar sommige jagters tevrede is met 'n paar skedelmonterings teen die braaiplek se muur, terwyl ander met niks anders as vol monterings van elke denkbare spesie wat gejag is tevrede is nie.

Maar wat is 'n trofee?

Toepaslike definisies van 'n trofee is die volgende:

- Enigiets wat tydens 'n oorlog, jagtog, kompetisie, ens. geneem word, veral wanneer dit as 'n aandenking, buit, prys of toekenning gehou word.
- Enigiets wat as 'n aandenking of bewys van 'n oorwinning, dapperheid, vaardigheid, ens. dien.
- Jagtrofee (soos die gemonteerde kop van 'n dier teen 'n muur) is herinnerings aan suksesvolle jagtogte.

Hoekom word trofeeë gejag?

Om jag werklik te kan ervaar, moet daar 'n element van eksklusiwiteit wees en moet dit 'n uitdaging wees om 'n skaars prooi te uitoorlê. As ons 'n paar skape oor die kraalheining skiet, jag ons nie – ons skiet. Om te jag beteken dat ons 'n ontwykende en skaars prooi soek. Jagter en prooi ontmoet tydens ware jag op 'n meer gelyke speelveld omdat die prooi sy natuurlike oorlewingsinstink en puik sintuie met verworwe “gejagte ervarings” kombineer om die jagter te ontwyk. Die prooi gebruik ook sy natuurlike kamoeflering om homself te versteek (bv. 'n koedoe); of maak van sy vlugvoetigheid gebruik om die jagter te ontwyk (bv. 'n springbok). Hy benut sy skerp sig-, reuk- en gehoorsintuie, sowel as daardie ongedefinieerde, maar beslis aanwesige “sesde sintuig”, en ken sy omgewing soos ons ons agterplase ken. Die feit dat trofeejagters dikwels uit 'n betonoerwoud met besoedelde lug, hoë geraasvlakke en snelwisselende ligintensiteit kom en oorwerk, gespanne en afgestomp is, tel ook in die prooi se guns.

Trofeejag kan ook beskou word as 'n manier om ons eie ego's te streef. Wanneer die San, Pigmee of Eskimo onderskeidelik met sy springbok, geelrug, duiker of rob na sy stamgenote terugkeer, word hy as verhewe beskou omdat hy sy bedrewenheid as jagter en voorsiener

bewys het. Die sukses vir die moderne jagter word ook dikwels gemeet aan die kwaliteit van die trofee. Hoe groter die horings, tande of skedel, hoe ouer, slinkser en meer ontwykend was die prooi gewoonlik. Die kwaliteit van die trofee weerspieël dus die jagter se ervaring en bedrewenheid. Die moderne jagter wys ook hoe bedrewe hy in ander “jagaktiwiteite” is, bv. in besigheid is die kliënt die “prooi”. Deur sy trofeeversameling bewys die persoon dat hy of sy ’n suksesvolle besigheidspersoon is wat dit kan **bekostig** om skaars en duur trofees te jag. Selfs al wys ons nooit ons trofees aan enige iemand nie, is ons graad van tevredenheid afhanklik van ons selfopgestelde standarde, en onderskryf ons oor die algemeen die persepsie van “Groter is beter”. Dis bloot menslik en natuurlik. Ons voel goed as ons ’n trofee by ons versameling kan voeg, want dit is ’n tasbare bewys dat ons nóg iets bereik het.

Nog ’n rede waarom ons trofee jag, is omdat ons die prooi respekteer, al klink dit dalk kontroversieel. Wie wil nou ’n bees of skaap jag? Niemand het tog respek vir ’n bees of skaap se ontwikkelingsvermoë, sluheid of natuurlike oorlewingsinstink nie. Wie wil ’n werfhoender met ’n haelgeweer skiet terwyl die fisant, geelbekeend of kwartel ’n veel groter uitdaging bied? Hoe meer die jagter met sy prooi in aanraking kom, of hoe minder kontak weens die dier se sluheid, hoe meer respek ontwikkel die ware trofeejagter daarvoor. Dink maar aan die sogenaamde “grey ghost”, die volop, gewone koedoe. Slegs jagters wat al telkemale met leë hande moes huiswaarts keer, het daardie spesiale bewondering en respek vir ’n koedoe. Aangesien jagters ook die gewoontes van hul prooi bestudeer, leer hul die spesie beter ken. Hoe meer daar probeer word om die gaping tussen hul eie vernuf en dié van die prooi te laat krimp, hoe meer respekteer hulle hul prooi.

Baie van ons jag ook trofee omdat ons versamelaars is. As kinders versamel ons handtekeninge, albasters, seëls, voëleiers, ens. As volwasse jagters versamel party van ons voorbeelde van jagspesies. Aangesien alle jagters se doelwitte in ’n mindere of meerdere mate verskil, verkies sommige om bv. al die spiraalhoringbokke of hartebees tipes, of dalk die Klein Vyf of Groot Vyf, te versamel. Ons versamelings word slegs beperk deur ons fisiese vermoëns, verbeelding, tyd en natuurlik finansiële vermoëns. Ons streef dalk daarna om trofee te versamel wat vir die Top 10 van Rowland Ward, SCI of CHASA kwalifiseer, maar ons slaag dalk nooit daarin nie. Die genot lê in die poging, of dit suksesvol is al dan nie.

Die meerderheid jagters stel hul eie etiese standarde, en monitor dit self. Omdat jag nie ’n toeskouersport is nie, hang dit van jou eie morele waardes af of jy ’n tarentaal op die grond sal skiet en dit vlug-skiet noem, of die trofee koedoe oor die bakkie se spieëltjie skiet en dit trofeejag noem. Ons bluf slegs onself as ons voorgee dat die groot kraagmanneljie leeu in ons trofeeversameling in Donker Afrika onder natuurlik omstandighede geskiet is, terwyl ons weet hy was op donkievleis grootgemaak, was gewoond aan mense en kon ons nie in die 50 ha-kamp ontwyk nie. Elkeen moet met sy eie gewete saamleef.

Die feit dat daar tydens ’n jagtog altyd ’n kans vir gevaar is, voeg ekstra dimensies van opwinding en uitdaging by. Jy kan deur ’n buffel of bosbokram bestorm word, uit die

boom of van 'n krans val, jou enkel verstuit, deur bye gesteeke of deur 'n slang gepik word, of malaria, Bilharzia of ander lewensgevaarlike siektes in die boendes opdoen. Jagters wat gereeld gevaarlike wild jag, neem hulself dikwels direk ná die jagtog voor dat dit die laaste een was, om maar net 'n paar maande later die volgende jagtog te begin beplan! Die "baklei-of-vlug" sindroom wat deur adrenalienvrystelling in die jagter se bloed veroorsaak word, kan soos 'n verslawende verdowingsmiddel raak. Dis nie eens nodig om 'n gevaarlike dier te jag om die effek van adrenalien te ervaar nie. 'n Steenbok trofee-rammetjie wat met 'n boog of handwapen gejag word, kan jou dieselfde gewaarwordinge gee, miskien net tot 'n mindere mate.

Die bekende skrywer, Robert Ruark, skryf in sy klassieke boek ***Use enough gun*** o.a. die volgende oor die jag van trofee, soos aan hom verduidelik deur die bekende beroepsjagter, Harry Selby:

Jy skiet nie 'n olifant nie. [...] Jy skiet die simbool van sy tande. Jy skiet nie om te dood nie. Jy skiet om dit wat jy skiet vir ewig te laat lewe. Om net enigiets dood te maak is 'n sonde. Om iets dood te maak wat binnekort sal doodgaan, maar so mooi is dat dit jou jare se plesier sal verskaf, is wonderlik. Alles gaan dood. Jy bespoedig net die proses. Wanneer jy 'n leeu skiet, skiet jy eintlik sy maanhare, iets wat jou trots sal maak. Jy skiet ter wille van jouself, nie net om dood te maak nie.

Ruark skryf verder, na hy 'n besonderse leeu saam met Selby geskiet het, die volgende:

"Ek het reeds soos 'n inboorling van Afrika begin dink: as jy dit wat jy jag genoegsaam respekteer, dit skoon en op die dier se gebied skiet, as jy die wonder van die dag – die lug, die reuke, die briesie, die blomme – in jou gedagtes vasvang, dan het jy nie net bloot 'n dier doodgemaak nie. Jy het onsterflikheid verleen aan 'n gedierte wat jy gedood het omdat jy hom liefhet en vir altyd wil besit sodat jy die dag vir altyd kan herleef. [...] Dit is beter as om toe te laat dat hy 'n paar jaar ouer word of deur 'n seun vermink en lewendig deur hiënas geëet te word. Dood is nie 'n grusame ding in Afrika nie – nie as jy dit wat jy doodmaak respekteer nie, nie as jy doodmaak om jou mense en jou herinneringe te voed nie.

GESKIEDENIS VAN DIE SUID-AFRIKAANSE MEETSISTEEM

Na lang oorweging en behoorlike beredenering het die Konfederasie van Jagtersverenigings van Suid-Afrika (CHASA) besluit om aan geaffilieerde verenigings voor te stel dat 'n eg Suid-Afrikaanse meetsisteem ontwikkel word.

Die gedagte is heelhartig deur alle verenigings aanvaar en op 7 November 1986 is 'n subkomitee deur CHASA aangewys. Hulle moes 'n voorlegging voorberei oor 'n metode van meting wat deur die ledeverenigings gevolg kan word.

Daar is behoorlik aan alle aspekte rakende so 'n sisteem aandag geskenk, met die volgende riglyne as basis:

- Dit moes 'n eg Suid-Afrikaanse karakter hê en in alle opsigte aan ons behoeftes voldoen
- Dit moet 'n eenvoudige en maklik verstaanbare sisteem wees wat die moontlikheid van subjektiewe interpretasies uitskakel en sodoende die grootste mate van akkuraatheid bewerkstellig
- Daar moet kontinuïteit in die sisteem wees deurdat die neergelegde vorm in sy geheel moet bly voortbestaan sonder voortdurende wysigings daaraan

Met hierdie sisteem word daar erkenning verleen aan die spesies, subspesies en verspreidingsgebiede soos deur ROWLAND WARD gebruik (met enkele uitsonderings) in uitgawes 1-19 van hul *Records of Big Game*.

Uitsonderings is as volg:

Springbok (gewoon en westelik)

Daar word vir die doel van hierdie sisteem geen onderskeid getref nie. Alle springbokke word dus saamgegroepeer en die verspreidingsgebied sal dus die totale gebied van die twee subspesies uitmaak.

Rooibok (suidelik en swartgesig)

Die onderskeiding tussen die twee subspesies sal behoue bly, onderworpe aan die volgende voorwaardes t.o.v. die swartgesigrooibok:

- a. Finale beslissing vir opname in nasionale lys berus by die subkomitee van CHASA.
- b. Die volgende moet tesame met inskrywing ingedien word:

- ▷ Duidelike kleurfoto's van die gesig van die dier van voor (portret), sowel as van die kant (profiel).
- ▷ Volle besonderhede aangaande datum gejag, presiese plek (plaasnaam, distrik en land), asook naam en adres van eienaar van plaas waar trofee gejag is.

Lechwe (rooi en Kafue)

'n Derde subspesie word bygevoeg, nl. die eksotiese rooi lechwe, met huidige verspreidingsgebied die RSA en Namibië.

Defasse Waterbok (Rhodesies en Angolees)

Slegs een subspesie word hier aanvaar, nl. Rhodesiese Defasse waterbok. Die verspreidingsgebied daarvan sluit die totale verspreiding van die twee subspesies in.

Bastergemsbok (suidelik en Angolees)

Slegs een subspesie, nl. die suidelike bastergemsbok, word erken. Die verspreidingsgebied daarvan sluit die totale verspreiding van die twee subspesies in.

HOE OM TE WERK TE GAAN VIR INSLUITING VAN 'N TROFEE IN DIE SA REKORDBOEK

Enige lid van 'n lidvereniging van CHASA kan sy of haar trofee ooreenkomstig die SA Meetmetode laat meet, hetsy individueel deur 'n CHASA Amptelike Meter of tydens sy of haar lidvereniging se amptelike trofeekompetisie, en indien die trofee dieselfde of langer meet as die minimum kwalifiserende vereiste, kan hy of sy daardie trofee in die SA Rekordboek laat insluit.

Vir meer inligting, kontak CHASA Hoofkantoor by 041-922 5600.

Webwerf: www.chasa.co.za

HANTERING VAN TROFEE

Wenke vir die hantering van 'n trofee

- Slag die dier so gou as moontlik af. Bederf begin onmiddellik na die dier dood is, en 'n vertraging kan daartoe lei dat die hare begin afval. Dit gebeur veral met die klipspringer, njala en bosbok.
- Moenie die karkas oor klippe of gruis sleep nie. Indien dit nie opgelig kan word nie, rol dit op 'n swaar seil en sleep die seil met die karkas daarop.
- Probeer om iets sag onder die karkas agterop die bakkie te sit om die vel sodoende te beskerm. Wees versigtig om nie die vel of horings te beskadig wanneer dit op- of afgelaai word van die voertuig wat die karkas gaan haal het nie, en ook nie tydens die vervoerproses nie.
- Hou die karkas koel en uit die son. Hitte kan lei tot haarverlies.
- Verwyder alle vet en vleis van die vel, aangesien dit kan lei tot verrotting. Wees veral noukeurig met sebra, maar maak seker dat die maanhaar se haarfollikels nie beskadig word nie.
- Was die velle deeglik om alle vuiligheid en bloed te verwyder, en week vir ongeveer 5 ure in 'n sterk soutbad waarby 'n paar doppies Savlon of Dettol gevoeg is om enige bakterieë te dood.
- Hang die vel vir 'n klein rukkie op om die meeste water te laat afloop voordat dit gesout word.
- Gebruik altyd vars sout.
- Laat lê die swaar gesoute vel vir 48 uur, skud dan die sout af en hang in 'n koel plek in die skaduwee om droog te word (nooit in die son nie).
- Moenie velle oor enige metaalpype hang nie; roesmerke kan die vel bederf.
- Moenie velle in 'n plastieksak verpak nie; gebruik liever 'n oop emmer.
- Maak langwerpige snitte, ongeveer 10 cm uitmekaar, op velle dikker as 7 mm om die sout toe te laat om lekker in die vel in te trek.
- Moet nooit formalien-produkte gebruik om die velle te preserveer nie.
- Karbadust en naftaleen kan insekte weghou wat andersins die trofee kan bederf.
- Gebruik goeie, skerp messe, wat snyongelukke sal voorkom.

Souting

- Gebruik slegs skoon, goeie kwaliteit sout, verkieslik sout met 'n fyn grein.
- Plaas 'n laag sout op die vloer en laat lê die vel met die hare na onder daarop.
- Vryf die sout deeglik in die nat kant van die vel in, veral in al die skeurtjies en holtes, en kry 'n dik laag sout op die vel. 'n Hele paar velle kan opmekaar gestapel word indien dit op hierdie manier ingesout is.
- Berg die gesoute velle op dié manier vir ongeveer 24 tot 48 uur, skud dan die oortollige sout af en hang dit in die skadu om droog te word.
- Vou die vel terwyl dit nog klam is op (hare na binne) in die vorm waarop dit vervoer gaan word om te verhoed dat die vel kraak.
- Vou dit dan weer oop sodat dit verder kan uitdroog.
- Velle moet opgevou word met die hare na bo. Vou die kante in na die middel toe sodat die hare beskerm kan word.
- Moet nooit die velle in plastieksakke of geseëde houers stoor of vervoer nie (selfs nie eers vir kort rukkies nie), aangesien dit die vel totaal gaan bederf.
- Merk alle velle en trofeë duidelik. "Cable ties" en plastieketikette wat van die meeste taksidermiste aangekoop kan word, of self tuis gemaak word, werk uitstekend. Skryf alle noodsaaklike inligting met 'n permanente pen op die etiket.

Let wel:

Berg velle en trofeë buite bereik van knaagdiere, honde, ens.

Snitte vir 'n skouermontering

Maak 'n v-snit tussen die horings, en sny dan teen die middel van die rug af. Indien die dier 'n maanhaar het, sny aan die een kant daarvan. Hou die kant waarna jy wil hê die kop moet kyk in gedagte wanneer jy aan die maanhaar werk. Sny ongeveer $\frac{1}{3}$ in die lengte van die lyf reg rondom die lyf, en dan rondom die twee voorbene op die knieë. Begin dan om die dier se mantel af teslag.

Daar is geen spesiale kuns of geheim aan die afslag van 'n gewone wilde dier nie. Sommige (soos 'n vlakvark) is 'n bietjie moeiliker, of ander (soos die eland) is baie groot, maar die belangrikste is om geduldig te wees, 'n vlymskerp mes te hê, en aandag aan detail te gee. Hou die afslagters dop, kry wenke by hulle, en oefen op 'n paar van jou eie biltongdiere. Onthou: oefening baar kuns.

Kopbene

Sny die hele kopbeen teen die nek af. Sny soveel vleis as moontlik af, en verwyder die onderkaak, aangesien die meeste taksidermiste dit nie nodig het nie.

Verwyder die brein deur die opening van die rugmurg deur dit eers deeglik met 'n stok te roer en dit dan met water uit te was. Herhaal totdat alle breinweefsel verwyder is.

Jy kan ook die kopbeen in 'n drom kookwater plaas om die vleis van die gesig sagter te maak sodat dit maklik verwyder kan word. Wees versigtig om nie die horings of die horingbasis van rietbok en rooi ribbok in die water te laat kom nie. Die water kan daardie dele beskadig. Maak seker dat die horings beskerm is indien die water oor 'n vuur verhit word. Dreineer die water uit die kopbeen.

Vul die brein- en neusholtes met sout en laat eenkant buite bereik van knaagdiere, ens. staan totdat dit droog is, en stuur dit dan na die taksidermis.

Indien jy die kopbeen self vir 'n Europese montering wil gereedmaak, verf die kopbeen as dit droog en skoon is met verdunde waterbasis kouelym en die horings met formalien en "blackoxide" en houtboorder oplossing (PCP), of spuit dit met Q20.

Bushpig

Potamochoerus porcus

Measuring Method: K

Minimum: 6"

Measurements - (a) Length of longest lower tusk and (b) length of longest lower tusk protruding from the gums

Giant Forest Hog

Hylochoerus meinertzhageni

Measuring Method: J

Minimum: 6"

Measurements - (a) Length of longest upper tusk and (b) length of longest upper tusk protruding from the gums

Measurements						
a	b	c	Locality	Date	Hunter	Ranking
8"	5 5/8"		MBoki, CAR	1994	MP Callender	1

Guenther's Dik-Dik*Rhynchotragus guentheri*

Measuring Method: A

Minimum: 2 ¼"

Measurements - (a) Length (b) circumference and (c) tip to tip

Measurements						
a	b	c	Locality	Date	Hunter	Ranking
2 15/16"	1 1/2"	15/16"	Omo Valley, Ethiopia	1992	N Van Rooyen	1

Hippopotamus*Hippopotamus amphibius*

Measuring Method: K

Minimum: 26"

Measurements - (a) Length of longest lower tusk and (b) length of longest lower tusk protruding from the gums

Northern Grant's Gazelle

Gazelle granti lacuum

Measuring Method: A

Minimum: 23"

Measurements - (a) length, (b) circumference and (c) tip to tip

Measurements						
a	b	c	Locality	Date	Hunter	Ranking
27 9/16"	6 1/4"	12 1/6"	Omo Valley, Ethiopia	1992	N Van Rooyen	1

Nyala

Tragelaphus angasii

Measuring Method: B

Minimum: 26"

Measurements - (a) length, (b) circumference and (c) tip to tip

Measurements

Southern Impala

Aepyceros melampus melampus

Measuring Method: A

Minimum: 23 ½"

Measurements - (a) length, (b) circumference and (c) tip to tip

Measurements

Giant Forest Hog

Hylochoerus meinertzhageni

Measuring Method: J

Minimum: 6"

Measurements - (a) Length of longest upper tusk and (b) length of longest upper tusk protruding from the gums

Measurements

a	b	c	Locality	Date	Hunter	Ranking
8"	5 5/8"		MBoki, CAR	1994	MP Callender	1

Guenther's Dik- Dik

Rhynchotragus guentheri

Measuring Method: A

Minimum: 2 1/4"

Measurements - (a) Length (b) circumference and (c) tip to tip

Measurements

a	b	c	Locality	Date	Hunter	Ranking
2 15/16"	1 1/2"	15/16"	Omo Valley, Ethiopia	1992	N Van Rooyen	1

Hippopotamus

Hippopotamus amphibius

Measuring Method: K

Minimum: 26"

Measurements - (a) Length of longest lower tusk and (b) length of longest lower tusk protruding from the gums

Southern Impala

Aepyceros melampus melampus

Measuring Method: A

Minimum: 23 ½"

Measurements - (a) length, (b) circumference and (c) tip to tip

Measurements

Steenbok

Raphicerus campestris

Measuring Method: A

Minimum: 4 ½"

Measurements - (a) Length (b) circumference and (c) tip to tip

Measurements

Warthog

Phacochoerus aethiopicus

Measuring Method: J

Minimum: 13 ½"

Measurements - (a) Length of longest upper tusk and (b) length of longest upper tusk protruding from the gums
